Résumé

---

La réalisation ITRF2008 (dernière en date) de l'International Terrestrial Reference System calculée par le Laboratoire de Recherche en Géodésie (LAREG) de l'IGN est le résultat de la combinaison des référentiels terrestres issus des quatre techniques de géodésie spatiale (c'est à dire DORIS, GNSS, SLR et VLBI). Pour réaliser un repère unique, un moyen consiste à ajouter dans la combinaison les résultats de rattachements sur des sites co-localisés. L'observatoire géodésique de Metsähovi (Finlande) dispose d'une station DORIS, d'une station VLBI et d'une station GNSS permanente, intégrée dans le réseau de l'IGS. Le présent rapport décrit le rattachement de précision réalisé sur ce site en juillet 2012 suite à l'installation d'une station GNSS REGINA et de la rénovation de la station DORIS .

The ITRF2008 (latest) realization of the International Terrestrial Reference System computed by the Laboratoire de Recherche en Géodésie (LAREG) at IGN is the result of the combination of reference frame from four space geodesy techniques (i.e. DORIS, GNSS, SLR and VLBI). One way to realize one common frame consists in adding results in the combination from local ties at co-location sites. A VLBI station, a DORIS station and a permanent GNSS station, included in IGS network, are installed at the Metsähovi Research Station (Finland). This report describes the local tie survey carried out at Metsähovi in July 2012, following the installation of the stations.

## 1. Introduction

### 1.1. Context

The International Terrestrial Reference Frame (ITRF) is the result of a combination of different terrestrial reference frames provided by the four space geodetic techniques:

- Very Long Baseline Interferometry (VLBI)
- Satellite Laser Ranging (SLR)
- Global Navigation Satellite System (GNSS)
- Doppler Orbitography and Radiopositioning Integrated by Satellite (DORIS)

To perform this combination between independent reference frames, it is necessary to have some co-location sites where the various techniques are operating, from which tie vectors between their reference points have been surveyed in three dimensions.

According to GGOS objectives, a millimeter accuracy is required for the local ties.

In charge of the REGINA network deployment and the DORIS network maintenance, IGN carries out local tie surveys as far as a REGINA or DORIS station is co-located, with the following purpose:

- assign coordinates to new instruments reference points;
- provide tie vectors between instruments reference points (i.e. DORIS, GNSS, SLR, VLBI, tide gauge);

This document presents the local tie survey performed at Metsähovi (Finland), which took place in July 2012 within the framework of the REGINA station installation and the DORIS station renovation.

## Acknowledgements

On behalf of CNES and IGN, we would like to acknowledge Prof. Markku Poutanen, director of Geodesy and Geodynamics department from FGI for the welcome accorded to us. Our special thanks to Jyri Näränen, researcher from Geodesy and Geodynamics department, who has supplied a efficient assistance to ensure the success of the mission. FGI has been particularly hospitable. Thank you to them for their logistical support, efficiency, availability and good mood.

## 2. Co-location site description

### 2.1. Site description

The local ties survey is performed in Finland at Metsähovi, about thirty kilometers west of Helsinki.

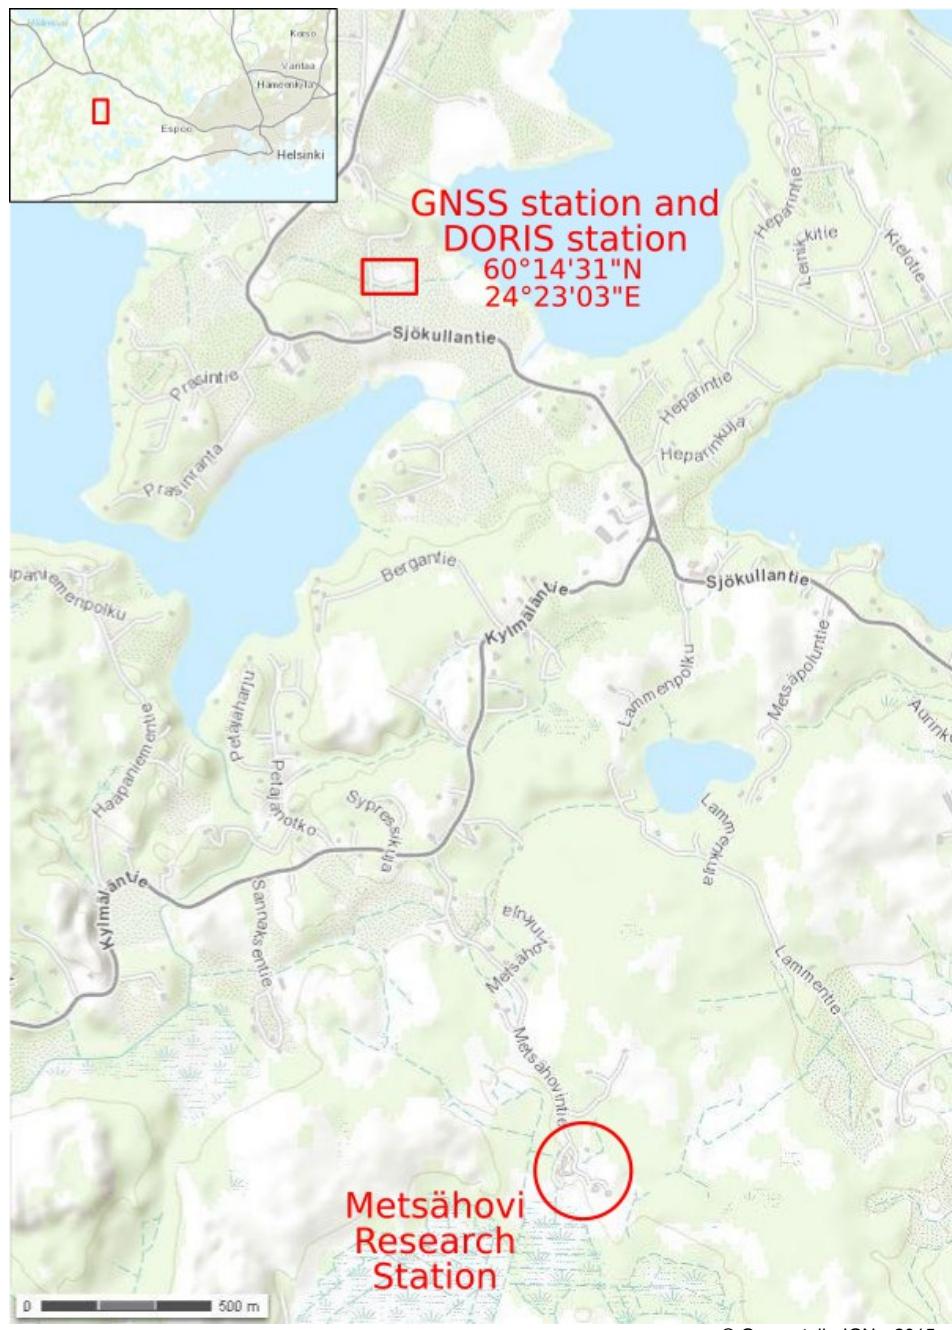

The site is located at the research station managed by the Finnish Geospatial Research Institute, the research and expert Finnish institute that performs research and development for spatial data infrastructures.

The Metsähovi Research Station is divided into two separate sites within 3 km of one another :

- the main site hosting all major space geodetic observing techniques : GNSS, SLR and VLBI, gravimeter and fundamental points for the national Finland reference system.
- the secondary site with DORIS and GNSS stations close to a photogrammetric test field in Sjökulla.

The topometric local tie survey was performed between REGINA GNSS station and DORIS station.

In addition, GNSS observations have been carried out to tie the permanent REGINA GNSS station to the permanent GNSS station located at Metsähovi Research Station, part of IGS network.

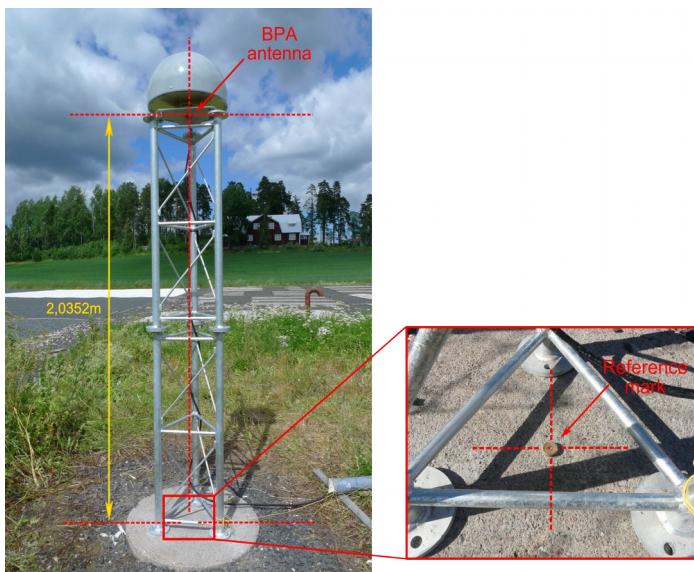

## **2.2. Co-located points**

### **2.2.1. GNSS station - METG**

A permanent GNSS station named METG has been installed during the campaign. This station is dedicated to the GNSS real time Network for IGS and Navigation (REGINA) project. The antenna is a Trimble TRM 59800.00 type with SCIS radome. This antenna is mounted on top of a 2 m high stainless steel rigid structure and anchored into a concrete pad. The reference point is a brass mark embedded into the concrete at located vertically down from the BPA (Bottom of the Pre-Amp).

Acronym : <b>METG</b>	DOMES number : <b>10503M002</b>
	
General view	Close-up view (reference point)

Description : antenna monument and reference point.  
Antenna height is **2,0352 m**.  
See sitelog in appendix 6.2.

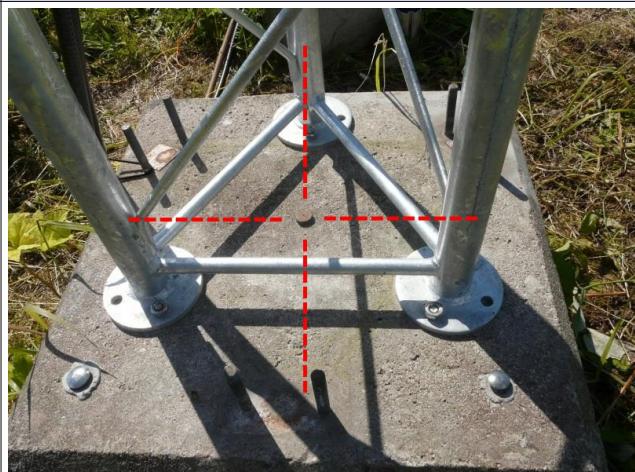

The reference mark is the former VLBI mark CDP 760.  
For further information, refer to the IGS website : [www.igs.org](http://www.igs.org).

### 2.2.2. New DORIS station – MEUB

On the spot since June 1998, the DORIS station has been renovated during the campaign. The current antenna with the acronym « MEUB » is installed on a 2 m high stainless steel rigid structure fixed on a concrete block 1.6m deep. A domed brass marker is embedded into the concrete block at the antenna support base.

### 2.2.3. Former DORIS station – METB

Initially set up on October 2000, DORIS station METB was removed during the campaign in order to install the new DORIS station MEUB on the same concrete block.

### 2.2.4. GNSS station – METS

The GNSS station « METS », part of IGS network, is located about 3 kilometres south from METG and MEUB, at Metsähovi Research Station.

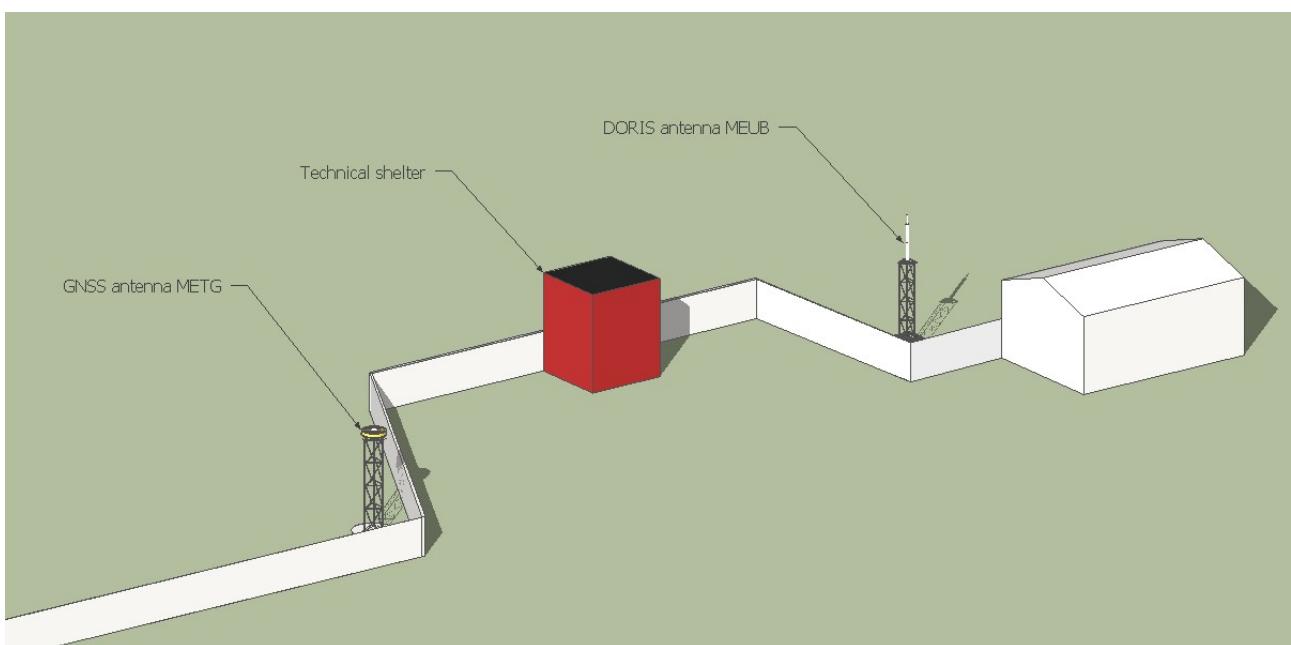

Acronym : <b>METS</b> DOMES number : <b>10503S011</b>

### 3. Site Survey description

#### 3.1. Organization

The site survey took place during the DORIS station renovation and REGINA station installation from June 27th to July 3rd, 2012 and performed by Thomas Donal (IGN) and Jean-Claude Poyard (IGN).

The topometric surveying operations were done on July 2nd, 2012.

#### 3.2. Equipment

All the surveying instruments used for this project belong to IGN, except GNSS REGINA instrumentations which belong to CNES.

##### 3.2.1. GNSS REGINA permanent station

Type	Model	Quantity
GNSS antenna	Trimble Choke Ring TRM 59800.00	1
GNSS receiver	Trimble NetR9	1

##### 3.2.2. Surveying instruments

The Leica total station used for the site survey, is yearly calibrated at IGN's calibration unit. It has a standard deviation of 0.3 mgon for angles and 1mm + 1.5 ppm for distances.

Type	Model	Quantity
GNSS receiver	Leica GX1230GG	2
GNSS antenna	Leica AX1202GG	2
Total station	Leica TCRA 1201+	1

### 3.2.3. Surveying accessories

Four Leica accurate reflectors calibrated with the total station were used to determine distances.

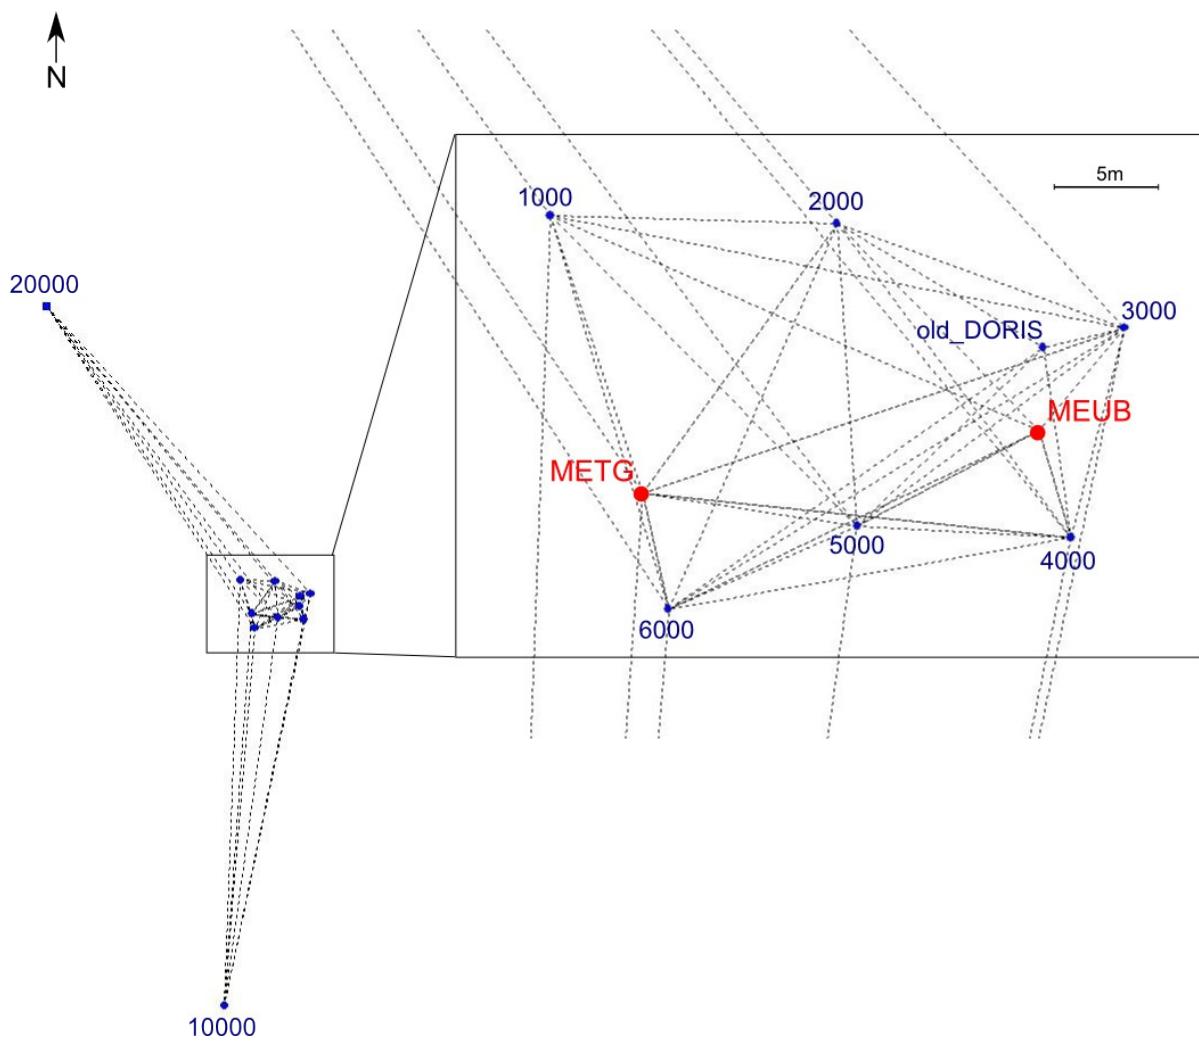

Type	Model	Quantity
Reflector	Leica GPH1P	4
Mini reflector	Leica GMP101	1
Carrier with optical plummet	Leica GZR3	2
Carrier with laser plummet	Leica SNLL121	2
Tripod	Leica wooden tripod	5
Meteo station	Kestrel 4500	1
Reflector pole	Leica GLS14	1

*Surveying operations*

### 3.3. Polygon network

All surveying operations have been carried out in such a way to provide the highest accuracy for the 3D vectors determination between the observing reference points.

*General polygon network*

Observations were done by total station from six temporary stations : 1000, 2000, 3000, 4000, 5000 and 6000.

### **3.4. Surveying method**

All the lines of sight have been observed with the total station. Horizontal directions and zenith angles were observed in data sets, each set consisting in one reading in both direct and reverse theodolite positions. Distance measurements were observed at least twice over each line. Meteorological data (atmospheric pressure and temperature) used to correct distance measurements, were recorded during the operation.

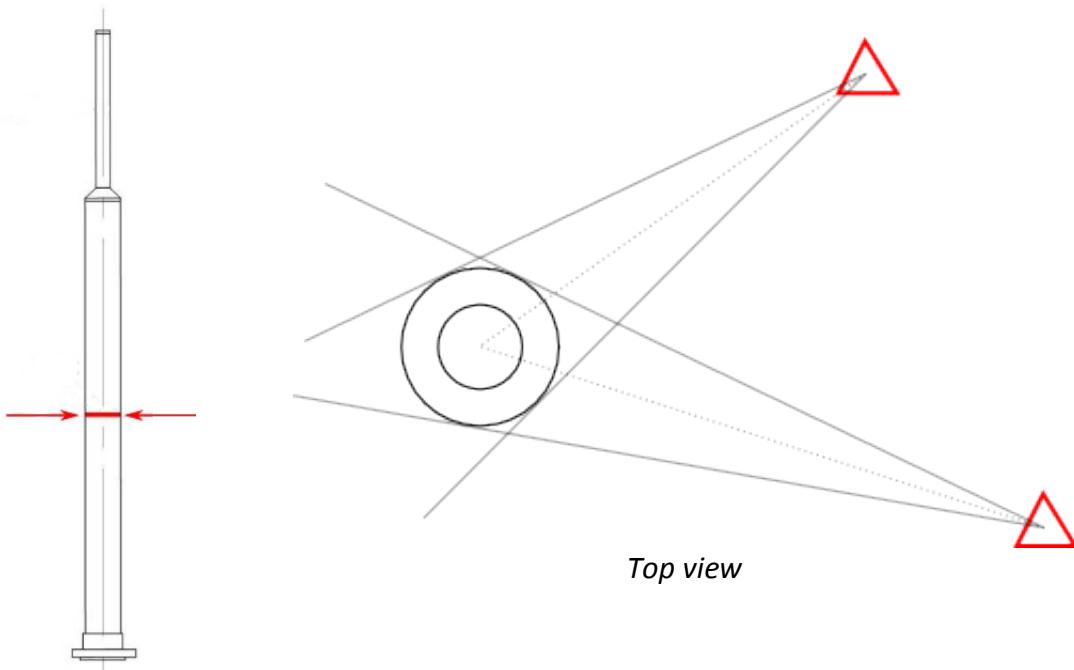

The set up strategy mixes GNSS and conventional observations. The GNSS observations are used to get the polygon bearing.

#### **3.4.1. Permanent stations reference point**

##### **MEUB reference point :**

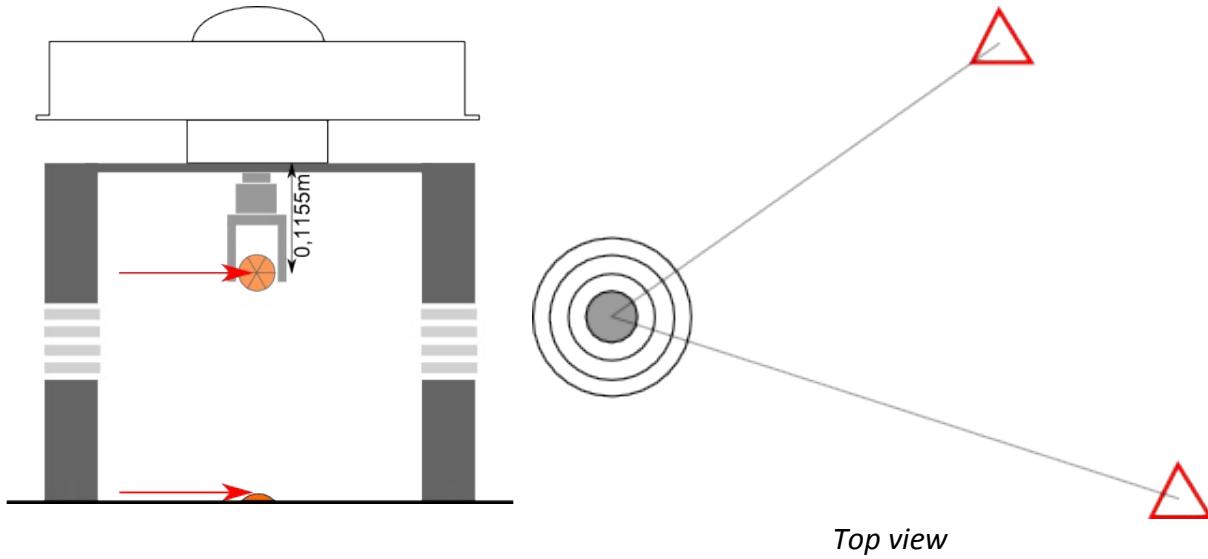

The reference point of DORIS antenna has been determined indirectly.

From each surveying station aiming at the antenna, right and left tangents to the DORIS antenna close to the ARP (red circle) were observed. In the adjustment, horizontal and zenithal angle observations were simply averaged to get its planimetric and altimetric positions.

### METG reference point :

From each surveying station aiming at the antenna, the reference point was directly observed through a prism directly set up in the vertical alignment of the ARP. Vertical offset from prism to ARP is accurately known (see below).

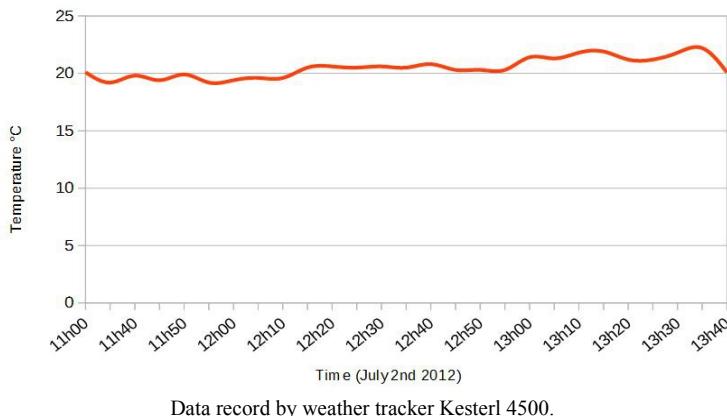

#### 3.4.2. GNSS observations

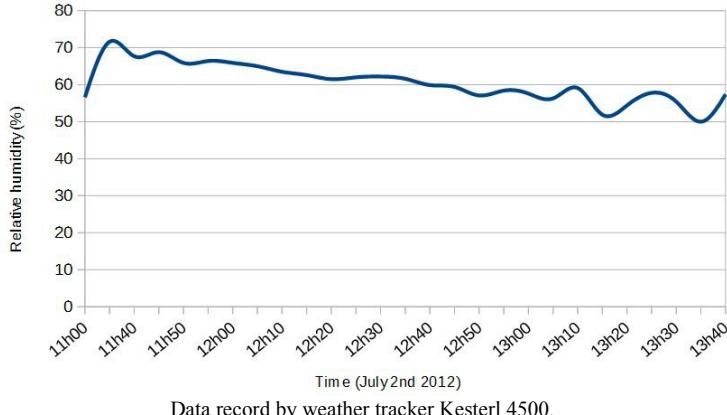

GNSS observations have been carried out in order to determine the orientation of the survey network. Orientations are known from the baselines between METG and stations 10000 and 20000. These two stations were temporary setup as far away as possible from the site. In addition, GNSS observations have been carried out to tie the permanent GNSS station METS to METG.

### 3.5. Weather data

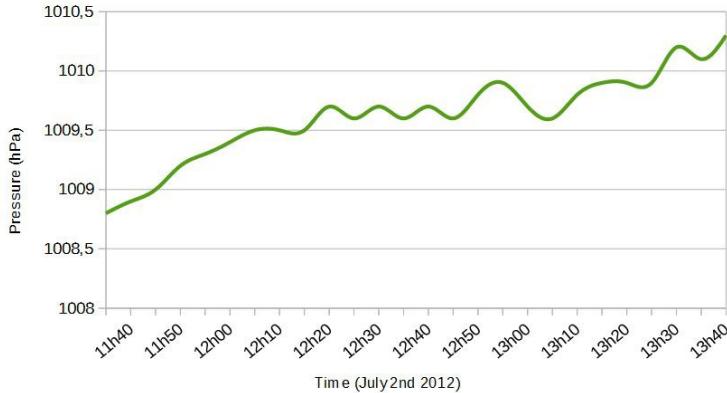

Metsähovi has a humid continental climate with warm summers and no dry season. Next graphics show weather conditions on site during the topometric survey measurements, i.e. July 2nd 2012, from 11 am to 2 pm.

Data record by weather tracker Kesterl 4500.

Data record by weather tracker Kesterl 4500.

July 2nd 2012, the weather was sunny and temperate. These data have been taken into account to correct distance measurements.

## 4. Computation

### 4.1. Determination of METG antenna reference point coordinates in IGb08

The resulting coordinates are expressed in IGb08 at the mid-epoch of a GNSS data set, i.e. epoch 2012:193 (11/07/2012). 7 daily data sessions have been processed, from 09 July 2012 to 15 July 2012

In summary, the computation process was the following: a first step to provide loosely constrained solutions, and a second step to combine these solutions in order to get final coordinates in the properly defined reference frame.

The use of a high level software *Bernese GNSS Software V5* is required with a thoroughly fixed parameterization.

The processing of a GNSS data set in ITRF is achieved by the use of IGS data and products expressed in ITRF2008 via IGb08 reference frame.

The computation process is described in appendix 6.4.

## **4.2. Local GNSS network**

The local GNSS baselines (see paragraph 3.4.2) were processed with Leica Geo Office V8.3 software using IGb08 precise ephemeris and the original set of « absolute » GNSS antenna calibrations (igs08.atx).

The corresponding LGO report file is given in appendix 6.5.

## **4.3. Global adjustment**

The final computation has been carried out by a Least Squares 3D Adjustment with the Microsearch Geolab version 2001.9.20.0 software. The input file (see appendix 6.6) comes from :

- Total station observations : horizontal and zenith angles, distances,
- Centring equations : relative position between points,
- Azimuths issued from the GNSS baselines process,
- METG antenna reference point coordinates have been constrained at 1 mm to its IGS08 (epoch 2012:193, 11/07/2012) values.

The a priori standard deviations used for the different observations with total station are :

- 0.8 mgon for horizontal and vertical angles,
- 1 mm for distances on prism,

These values are used for most of the targets in our Microsearch Geolab computation input file.

This adjustment provided coordinates and a covariance matrix of our survey work (appendix 6.7).

Geoid slope is insignificant around Metsähovi. The EGM2008 geoid model undulations have not been taken into account in the process to correct the vertical / normal deflation.

## 5. Results

### 5.1. Station name translation table

The following list sums up the main points of the Microsearch Geolab input file.

Point description	Used name or code	Computation name
DORIS stations		
→ DORIS antenna reference point	10503S016	MEUB
→ DORIS pillar/domed mark	10503M006	MEUB_marker
→ Ex-DORIS antenna reference point	10503S015	METB
GNSS permanent station		
→ METS reference point	10503S011	METS
→ METG reference point	10503M002	METG
→ METG antenna reference point	-	METG_ARP

### 5.2. Adjusted coordinates and confidence regions

The results of the adjustment are the coordinates of all points and their confidence ellipsoids in the IGB08/ITRF2008 at the mean epoch of the observations (i.e. epoch 2012 :193).

The table below provides the 3D coordinates and confidence region at 95 % of the points of interest.

The whole covariance matrix was computed, then it was possible to extract from it the covariance submatrix for the 4 main points of interest i.e. MEUB, METB, METS and METG for the ITRF2014 computation. Finally, this covariance submatrix has been converted into the SINEX format using the « geotosnx » tool provided by Z. Altamimi. The resulting SINEX file (10503\_IGN\_2012-184\_V12.SNX) is provided in appendix 6.8

### 6.1. «MEUB» DORIS station site log

METSAHOVI DORIS site description form

#### 0. Form

Prepared by : SIMB (DORIS installation and maintenance department)  
Date prepared : 11/04/2013  
Report type : UPDATE

#### 1. Site location information

Site name : METSAHOVI  
Site DOMES number : 10503  
Host agency : Finnish Geodetic Institute  
City : Masala  
State or province :  
Country : FINLAND  
Tectonic plate : EURA  
Geological information :  
  
Geographical coordinates (ITRF) :  
North Latitude : 60 deg 14' 31''  
East Longitude : 24 deg 23' 4''  
Ellipsoid height : 62 m  
Approximate altitude : 42 m

#### 2. DORIS antenna and reference point information

##### 2.1

Four character ID : META  
Antenna model : Alcatel  
Antenna serial number : 53  
IERS DOMES number : 10503S013  
CNES/IGN number : 105031  
DORIS SSALTO number : 6  
Date installed (dd/mm/yy) : 21/06/1988  
Date removed (dd/mm/yy) : 25/10/2000  
Antenna support type : Guyed 3 metre tower  
Installed on : Concrete block  
Height above ground mark : 3.062 m  
Ground mark type : FGI mark fixed on the base plate.  
Ground mark DOMES number : 10503M004  
Notes :

##### 2.2

Four character ID : METB  
Antenna model : Starec 52291 type  
Antenna serial number : 68  
IERS DOMES number : 10503S015  
CNES/IGN number : 105032

#### 1. Site Identification of the GNSS Monument

Site Name : METSAHOVI  
Four Character ID : METS  
Monument Inscription :  
IERS DOMES Number : 10503S011  
CDP Number :  
Monument Description : STEEL GRID MAST  
Height of the Monument : 21 m  
Monument Foundation :  
Foundation Depth :  
Marker Description : BRASS BOLT ON BEDROCK  
Date Installed : 1992-05-01T12:00Z  
Geologic Characteristic : BEDROCK  
Bedrock Type : METAMORPHIC  
Bedrock Condition : FRESH  
Fracture Spacing : over 200 cm  
Fault zones nearby : NO  
Distance/activity :  
Additional Information : Antenna height stabilised by an invar bar.

#### 2. Site Location Information

City or Town : Kirkkonummi  
State or Province :  
Country : Finland  
Tectonic Plate : EURASIAN  
Approximate Position (ITRF)  
X coordinate (m) : 2892570.999  
Y coordinate (m) : 1311843.280  
Z coordinate (m) : 5512634.011

## **6.4. Bernese GNSS process**

The processing of a GNSS data set in ITRF is achieved by the use of IGS data and products expressed in ITRF2008 via IGb08 reference frame:

- Ephemeris and Earth Orientation Parameters.
- GNSS observations, coordinates and velocities of IGS reference stations. Basically the observation data of about 12 IGS stations in a 1000 km radius from Metsähovi are available daily.
- Antenna calibration stemming from igs08.atx.

The computation is validated with respect to the following points:

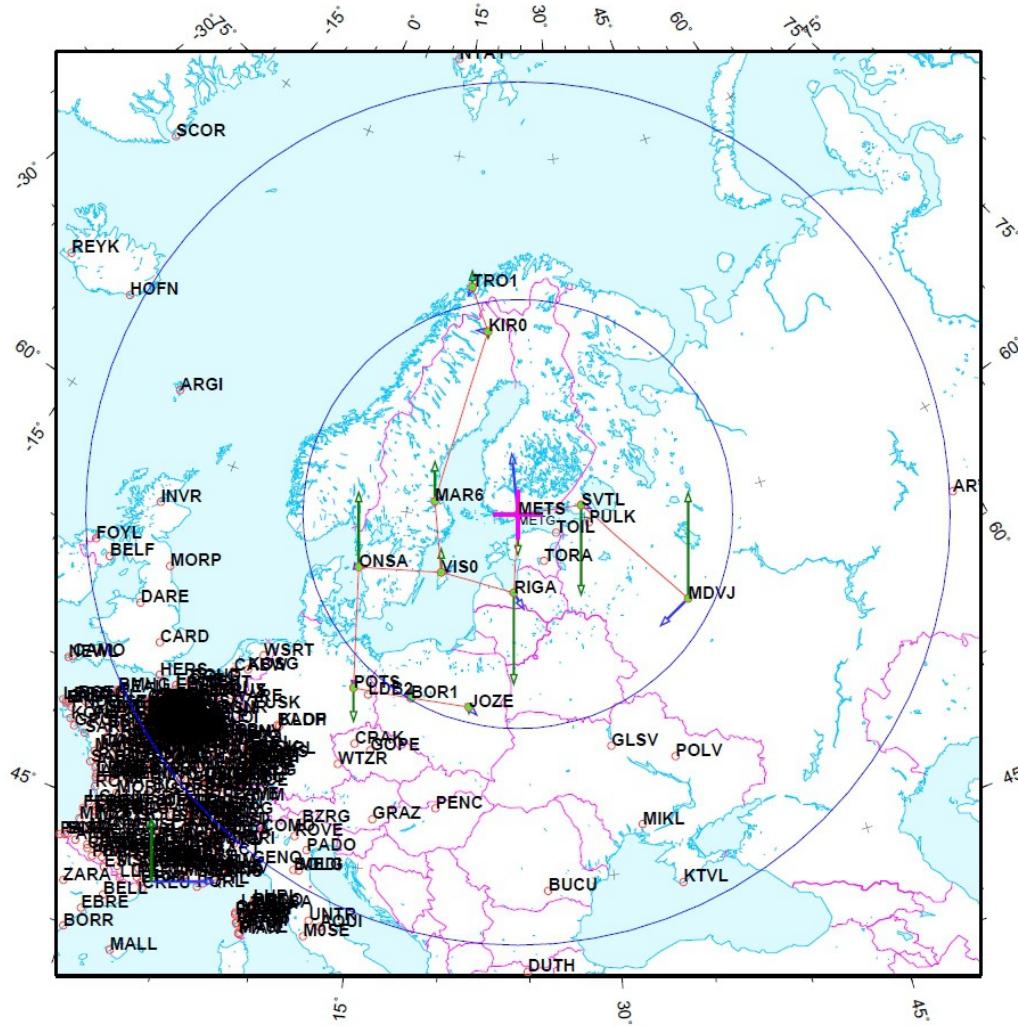

- Assessment of the Root Mean Square errors of the combined solution.
- Assessment of consistency between the daily solutions (repeatability).
- Assessment of alignment of the combined solution to the IGS08 reference frame.

### **▪ Daily processing steps**

7 daily data sessions have been processed, from 09 July 2012 to 15 July 2012 based on a network integer ambiguity fixed solution from ionosphere free double difference processing using IGS precise ephemeris and earth orientation parameters.

Each daily solution has been validated according to :

- Ambiguity integer fixed results
- Variance factor range
- Helmert adaptation from IGS stations computed coordinates to actual ones

#### ▪ Session Combination

Daily normal equations were merged using a least squares adjustment process in order to provide a final reference free combined solution. The residuals of the individual solutions with respect to the combined one have been computed and checked. The Root Mean Square errors and the consistency between the daily solutions (repeatability) were assessed.

- Root Mean Square errors

Next table shows the Root Mean Square errors of the combined solution (**mm** in North, East and Up component).

### SUMMARY OF SELECTED OPTIONS

OPTION	SELECTION
Computation Mode	Adjustment
Maximum Iterations	15
Convergence Criterion	0.00010
Residual Rejection Criterion	Tau Max
Confidence Region Types	1D 2D 3D Station
Variance Factor (VF) Known	Yes
Scale Covariance Matrix With VF	Yes
Scale Residual Variances With VF	No
Force Convergence in Max Iters	No
Distances Contribute To Heights	No
Compute Full Inverse	Yes
Optimize Band Width	Yes
Generate Initial Coordinates	Yes
Re-Transform Obs After 1st Pass	No
Geoid Interpolation Method	Bi-Quadratic

Microsearch GeoLab, V2001.9.20.0 GRS 80 UNITS: m,GRAD  
=====

STATISTICS SUMMARY	
Residual Critical Value Type	Tau Max
Residual Critical Value	3.8209
Number of Flagged Residuals	0
Convergence Criterion	0.0001
Final Iteration Counter Value	3
Confidence Level Used	95.0000
Estimated Variance Factor	1.2025
Number of Degrees of Freedom	175
Chi-Square Test on the Variance Factor:	
9.8555e-01 < 1.0000 < 1.5003e+00 ?	
THE TEST PASSES	
NOTE: All confidence regions were computed using the following factors:	
Variance factor used	= 1.2025
1-D expansion factor	= 1.9600
2-D expansion factor	= 2.4477
3-D expansion factor	= 2.7955
Note that, for relative confidence regions, precisions are	
computed from the ratio of the major semi-axis and the spatial	
distance between the two stations.
