1 INTRODUCTION

The Tahiti geodetic observatory, hereafter designated as “OGT” from its French name (Observatoire Géodésique de Tahiti), is a co-location site hosting three space geodesy techniques: Satellite Laser Ranging (SLR), GPS and DORIS.

During the combination of the individual technique solutions for the computation of the ITRF2005 realisation of the IERS terrestrial reference system, a centimetre-level discrepancy was detected between the SLR and GPS solutions on the one hand, and the available local tie connection on the other hand. Such a disagreement was not a complete surprise, since the short distance connection between both techniques was never actually measured, but resulted from a combination of two much longer baselines measured at different epochs, as shown in Fig. 1.

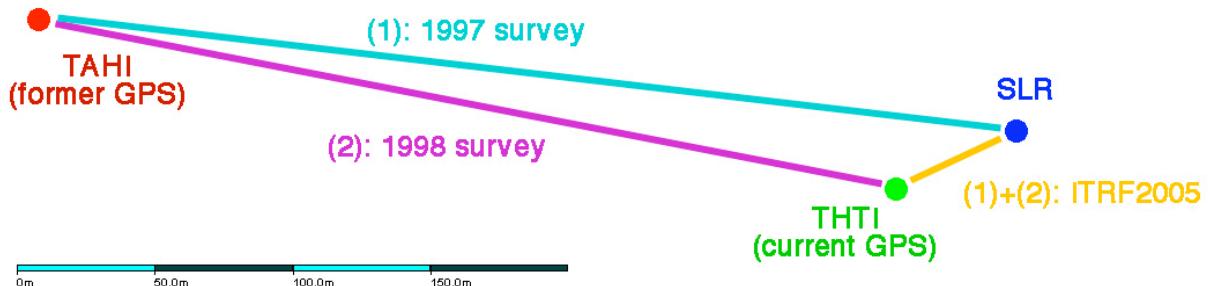

Fig. 1: sketch of the 1997 and 1998 baseline measurements

IGN-F (Institut Géographique National, France) has therefore decided to carry out a complete site survey, whose main objective would be to measure a direct connection between the SLR telescope reference point and the current permanent GPS station. Additionally, the current and former DORIS occupations, as well as the former GPS occupation, should be included in this global site computation.

2 SITE DESCRIPTION

2.1 General description

The Tahiti geodetic observatory is located on the campus of the French Polynesia university (Centre Universitaire de Polynésie Française), in the northwest part of the Tahiti island (Fig. 2). It is about two km south of the Faa'a airport (main airport of French Polynesia) and six km southwest of the centre of Papeete, the capital city of French Polynesia. The site is frequently – and incorrectly – named “Papeete” (IGS site logs, DORIS station name), whereas it is not located on the Papeete district, but in fact within the Punaauia city limits. The name “Tahiti” used on the SLR station log, although more general – it is the name of the whole island – is more correct.

Fig. 2: location of the OGT on Tahiti island

Tahiti, like all the Society Archipelago of which it is part, is in the UTC–10 time zone. The OGT is made of a main one storey building, and two trailers that host the SLR instruments and the telescope. Both the GPS and DORIS antennas are located on the terrace of the building, on top of load-bearing walls.

The “administration” building of the university campus, located about 300 metres west of the OGT, was the initial location of the GPS and DORIS antennas. There is no direct visibility between both sub-sites, but they are both visible from the top of the “Presidency” building located next-door to the OGT. A general aerial view of the campus is given in Annex 1.

2.2 Site history

The first space geodesy instrument on this site was the DORIS station whose “PAPB” antenna was installed in July 1995 on the roof of the administrative building. At the same time, the “TAHI” mark was put on the same roof and tied to the DORIS antenna, in expectation of the planned installation of a permanent GPS station, which eventually happened in April 1997.

A PRARE antenna was also installed and moved later to the OGT before the PRARE system end of operation.

A global survey of the recently built OGT was carried out by NASA/GSFC (team leader Vaughn Nelson) in August 1997, during the installation of the SLR. This survey included the main station mark (CDP 7124), three auxiliary marks (RM-1, RM-2 and RM-3) and three calibration piers (CAL-A, CAL-B and CAL-C), and the DORIS, GPS and PRARE antennas located 300 m away from the new OGT site.

In April 1998, the DORIS, GPS and PRARE stations were moved by IGN-France (surveyor Alain Orsoni) from the administrative building, to the OGT. The connection between the former and new antenna locations was measured by GPS observations. The OGT was officially inaugurated in May 1998.

In August 2000, the United States National Imagery and Mapping Agency (NIMA, now NGA since November 2003) installed a monitor station of the GPS space segment, also on the roof of the OGT main building.

2.3 Description of the current space geodesy points

2.3.1 The SLR station

The Tahiti SLR station (4-character code “THTL”) system reference is MOBLAS-8.

The telescope reference point (intersection of the rotation axes) was approximately centred above the ground reference mark during the installation, then the offset was measured.

The mark (a brass disk in a concrete monument flush with the main concrete pad) is identified as “SLR 7124” in the Geolab adjustment, and its DOMES number is 92201M007.

A self-centring plate is set on the bottom of the telescope mount.

Fig. 3: general view of the SLR telescope

2.3.2 The “THTI” GPS antenna

The GPS antenna is supported by a triangular plate on top of a 17 cm sided, one metre high lattice tower. This tower is bolted on the top of a load-bearing wall in the southwest corner of the terrace roof of the main OGT building. The antenna reference mark is a small domed brass mark embedded in the concrete, identified as “THTI”. Its DOMES number is 92201M009.

Fig. 4: the THTI GPS antenna on the roof

2.3.3 The “PAQB” and “PATB” DORIS antennas

During the survey, the DORIS antenna (code “PAQB”) and its supporting tower were replaced, as part of an upgrade process of the whole DORIS station, which also included a change of the beacon and meteorological station. The new antenna reference point is identified as “PATB”, and its DOMES number is 92201S010. The reference point of all the DORIS antennas is defined as the projection of the 2 GHz phase centre (located near the middle of the narrow end of the antenna) on the plane containing the red circle (Fig. 5). The tower which supports the DORIS antenna is located in the northeast corner of the terrace roof, on the intersection of two load-bearing walls. A small domed brass mark (DOMES 92201M008) is centred below the DORIS antenna reference point.

2.4 Description of the former space geodesy points

2.4.1 The “TAHI” GPS antenna

This antenna was supported by the same one-metre tower as the current GPS antenna. It was located on top of the administrative building, from April 1997 to April 1998. The ground mark on which it was centred had been installed much earlier, during the installation of the first DORIS antenna (PAPB). This mark (DOMES 92201M006), labelled "UNIV./UGP1" at that time, was connected to the DORIS antenna.

Fig. 5: the DORIS PAQB antenna reference point

2.4.2 The “PAPB” DORIS antenna

This antenna was operated between July 1995 and April 1998, on the roof of the administrative building. It was installed on a one-metre tower. Its DOMES number was 92201S007. Although the ground mark (DOMES 92201M004) was still present in October 2007, it was not included in the current survey as it was already accurately connected to TAHI in 1995.

2.5 Description of the other points

2.5.1 RM-2

RM-2 is one of the reference marks installed and surveyed by NASA/GSFC in 1997. It is a brass disk (Fig. 6) set in a 29 cm diameter concrete monument flush with the ground, in the northwest corner of the fenced area that hosts the SLR trailers (Fig. 7).

Fig. 6: the RM-2 mark

Fig. 7: a tripod set on RM-2

2.5.2 RM-3

RM-3 is one of the reference marks installed and surveyed by NASA/GSFC in 1997. It is a 5/8 inch bolt in the centre of a stainless steel plate, on top of a 33 cm diameter, 1.55 m high concrete pillar (Fig. 8). The reference point is the intersection of the top of the plate, and the axis of the bolt.

Fig. 8: a total station set on RM-3

2.5.3 TM-1

TM-1 is a temporary mark: a nail hammered into the ground (Fig. 9). We chose to create this new point rather than occupying the existing RM-1, because the latter did not allow to sight as many surrounding points. It is located near the edge of the embankment slope, in the northwest corner of the OGT compound.

2.5.4 TM-5

TM-5 is a tribrach set on top of the Presidency building, without any actual materialisation. It was used only as a secondary azimuth mark. Although the TM-6 mark turned out to be much more useful, we decided to use TM-5 and keep it in the adjustment all the same.

Fig. 9: a tripod set on TM-1

2.5.5 TM-6

TM-6 is a target pasted on the waterproof coating of the Presidency building. Its location was chosen so that all points, including the former GPS location 300 m away, would be visible from this point.

2.5.6 Other points (not occupied)

The following points, built and surveyed in 1997 by NASA/GSFC, were not observed:

- RM-1: as mentioned above, this point did not allow to see many other points, partly because of the nearby tree, the SLR trailers (which were not present during the 1997 survey), and the building.
- CAL-A and CAL-C: these calibration pillars were no longer visible from most points, because of the vegetation growth over ten years.
- CAL-B: this calibration pillar was still visible from several points, but it would have been hardly usable, because it is now protected by a metal casing to prevent the theft of the calibration target.

3 SURVEY DESCRIPTION

3.1 Survey schedule

The survey was carried out by Hervé Fagard and Jean-Claude Poyard, both with the Worldwide Networks unit of IGN-F. After the whole DORIS equipment was upgraded on October 1st and 2nd

by H.Fagard, and J-C.Poyard returned on October 2nd from Rikitea (Gambier Archipelago) where he had carried out a survey of the DORIS antenna, the survey took place between October 3rd and October 6th. The weather was mostly sunny with very few showers, which was fortunate as the SLR roof must be closed as soon as it looks like it might rain, because this operation takes several minutes.

3.2 Survey equipment

All the necessary equipment, belonging to IGN-F, had been air freighted from mainland France beforehand.

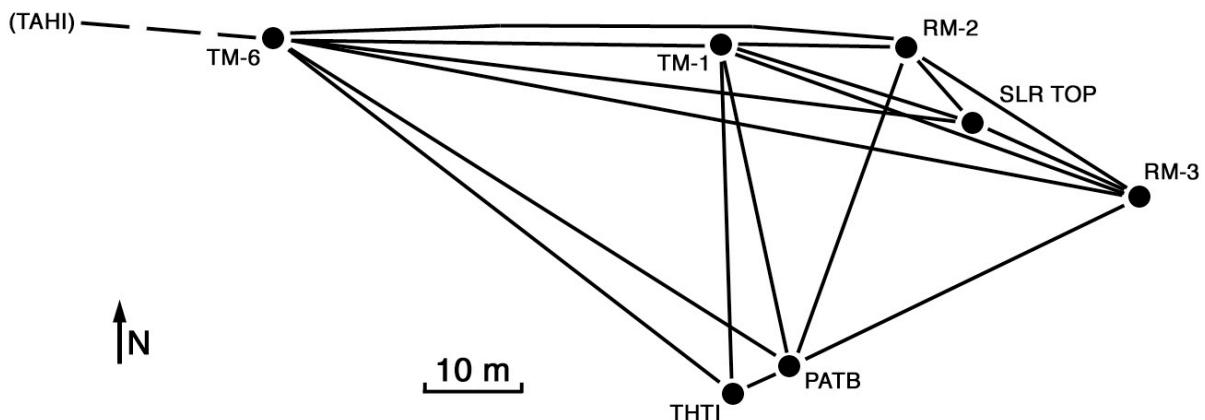

The equipment set was made up of:

- One Leica total station TC2002. This instrument, regularly calibrated by IGN's calibration unit, has a standard deviation of 0.15 mgon (angles) and 1 mm + 1 ppm (distances). For distance measurements, Leica corner cube reflectors (model GPHP1P), also calibrated, were used.
- One Zeiss Dini 10 electronic level, with 0.5 m and 2 m bar code staves.
- Two GPS receivers (Leica SR 530) and two GPS antennas (chokering Leica AT504), checked by IGN's calibration unit.
- A translation stage (manufactured by IGN) used to accurately centre various items on the telescope vertical rotation axis.
- A special interface (manufactured by IGN) allowing to force-centre any geodetic instrument on a DORIS antenna supporting plate.
- Three heavy (and therefore very stable) tripods.
- Miscellaneous essential items such as tribrachs, targets, etc.

3.3 Observations

3.3.1 General survey layout

The following sketch shows the visibility between all points included in the survey:

The following observations were carried out:

- Horizontal and vertical angles, and distances were measured using the total station, set on the following points: RM-2, RM-3, TM-1, TM-6.
- Double-run spirit levelling operations were carried out, one connecting RM-2, RM-3 and the 7124 ground mark, another one connecting RM-3, PATB and THTI. Moreover, the height difference between RM-3 and the self-centring plate of the telescope was measured.
- GPS observations were carried out on all points, with occupation times ranging from 6 to almost 17 hours.

3.3.2 Survey procedures

Horizontal observations from each point were realised in two sets, one face left and one face right. A measurement was rejected if the difference between both sets was found greater than 1,5 mgon. Likewise, vertical angles were measured twice: face left and face right.

Meteorological data (temperature and pressure) were recorded locally before and after each station occupation.

All data collected by the total station were transformed to the Geolab input format using a software developed by IGN.

For each levelling measurement, the level performed two readings, and the resulting value was validated only if both readings agreed to within 0.04 mm. Likewise, a third run had to be measured if the difference between the forward and the backward run was greater than $0.1 \text{ mm} \times \sqrt{n}$ ($n = \text{number of traverse legs}$). This could not be achieved when connecting the DORIS and GPS marks on the roof, because of the soft coating on the terrace which affected the tripod stability. The instrument collimation was checked daily.

The GPS observations were carried out at a 30 second sampling rate, using either Leica AT504 antenna. The observation sessions are summarised in the following table:

Point	Start (UTC)	End (UTC)	Antenna height (m)
PATB	DOY 276 / 4:07	DOY 276 / 20:43	-0.376
RM-2	DOY 278 / 4:21	DOY 278 / 12:36	1.471
RM-3	DOY 277 / 4:05	DOY 277 / 16:40	0.185
SLR TOP	DOY 276 / 21:29	DOY 277 / 3:45	0.328
TAHI	DOY 277 / 18:25	DOY 278 / 2:30	1.175
TM-1	DOY 278 / 3:45	DOY 278 / 16:46	1.523
TM-5	DOY 276 / 3:18	DOY 276 / 12:54	0.000
TM-6	DOY 277 / 3:47	DOY 277 / 13:51	1.470

3.3.3 SLR reference point and ground mark

The first step consisted in materialising the vertical axis of rotation of the SLR telescope. It was first rotated upside down so that the black self-centring plate (normally located on the bottom of the telescope) was on top of it. Then the telescope was set at the zero-degree elevation angle, using a 60 cm long carpenter's level placed on top of the flat surface of the mount shroud. Since the manual locking clamp on the telescope is not strong enough to ensure the telescope does not move, we placed two C-clamps (Fig. 10) on top of and near the locking clamp to avoid any unwanted rotation.

Fig. 10: C-clamps securing the telescope

Then a translation stage was placed on top of the self-centring plate and fitted with a target (Fig. 11). The target was sighted from one nearby theodolite location – chosen such as that the line of sight was perpendicular to one of the translation axes of the translation stage – and its position on the translation stage was noted. Then the telescope was rotated horizontally by half a turn, and the offset of the target was measured. Then the translation stage was adjusted by half the offset. The same procedure was performed after the telescope was rotated 90° off its original orientation. When done, the target axis looked fixed as the telescope was rotated, when sighted with the theodolite, indicating that it located exactly on the telescope vertical rotation axis.

Fig. 11: the translation stage with a target, on the telescope

Fig. 12: measuring the telescope offset

In order to measure the vertical rotation axis offset with respect to the ground mark (CDP 7124), we sighted the target from two perpendicular theodolite locations and plunged the theodolite down to the survey disk and marked the two orthogonal lines of sight on the disk (Fig. 12). The telescope offset which resulted from this measurement was: 15 mm south, 10 mm east of the punch hole in the brass disk.

The reference point of the telescope is defined as the intersection of its vertical and horizontal rotation axes. The horizontal rotation axis is materialised by the telescope eyepiece on one of its sides. We measured the vertical offset between the top of the self-centring plate (named SLR TOP in the Geolab adjustment) and the eyepiece axis as follows:

1. The diameter of the eyepiece was measured using a calliper gauge (imperial unit version), and found equal to 1.4 inch. Therefore the radius of the viewfinder is 0.0178 m.
2. The height difference between the top of the self-centring plate, and the top of the eyepiece, was measured by spirit levelling and found equal to 0.473 m. Since this measurement had to be done in difficult conditions (almost out of range of the half-metre bar code staff), it was checked using a carpenter's level and a tape, which gave 0.474 m, hence a good confirmation.

The resulting vertical offset between the SLR reference point (named SLR AXES INT in the Geolab adjustment), and the top of the self-centring plate was therefore **0.491 m**. This value differs by 2 mm from the value (0.489 m) provided by Jim Long (NASA/GSFC) and measured by Honeywell many years ago when the MOBLAS systems were being assembled and installed in the NASA SLR network.

The following table compares the measured north, east and up we measured, with the previously known values, given in the ILRS site log (see Annex 2). All values are in metres, from the ground mark to the SLR reference point.

	ILRS site log	2007 survey	Difference
N	-0.015	-0.015	0.000
E	0.011	0.010	0.001
h	3.143	3.141	0.002

GPS observations were made on this point by installing a GPS antenna on the translation stage (Fig. 13). The antenna height was measured from the top of the self-centring plate. This point (SLR TOP in the Geolab adjustment) was labelled SLRT in the GPS file.

Fig. 13: GPS antenna centred above the SLR telescope

Fig. 14: GPS antenna on the TAHI mark

3.3.4 DORIS antenna

Before removal, the former DORIS antenna (PAQB) centring and height were checked. The 2 GHz phase centre was 0.6 mm west and 2.3 mm south of the DORIS mark, and the antenna reference point was 1.416 m above the mark.

The new antenna (PATB) was centred above the mark within 1 mm, and the reference point was 1.422 m above the mark.

The new DORIS antenna top (where the 2 GHz phase centre is located) could be sighted from a couple of points. Other measurements were carried out while the antenna was temporarily removed, and replaced either with a tribrach supporting a target or prism, or with a GPS antenna, both force-centred on the DORIS antenna supporting plate using a special interface.

3.3.5 GPS “THTI” antenna

According to the THTI site log (see Annex 3), the Ashtech choke ring antenna is exactly centred above the mark (no north nor east offset), and its ARP is located 1.047 m above the mark. Our measurements gave slightly different values: ARP was 2 mm east, and 1.045 m above the mark. Therefore we decided to define two different points in the survey:

- “THTI” is the point defined by the site log, i.e. a “virtual” point located 1.047 m below the ARP. This is the point whose coordinates are computed by the IGS analysis centres, and published in the ITRF solutions.
- “THTI MARK” is the actual mark.

3.3.6 GPS “TAHI” antenna

The ground mark of the former GPS antenna TAHI could easily be found on top of the administrative building, as well as the bolts used to fasten its supporting tower. A spare one-metre tower (the former DORIS one) was fastened very strongly on these bolts, and a GPS antenna (Fig. 14) could be accurately centred above the mark using a crafty DIY device made up of a tribrach and the special DORIS interface.

A target was also set on this point, and sighted from the roof of the Presidency building (TM-6) in order to improve the orientation of the local survey network which would otherwise lack a long distance orientation.

3.3.7 Other marks

Heavy tripods were set on TM-1, TM-6 and RM-2 (Figs 7 and 9). They were centred using a centring rod, then the total station, target or prism were centred using the forced centring device which is part of the tripod upper plate.

4 COMPUTATIONS

4.1 On-site validation

The GPS baselines were processed using Trimble Total Control (TTC), version 2.73.

Then all measurements (conventional and GPS) were included in a Geolab adjustment, which showed no major outlier.

4.2 GPS baseline computation

The final computation was also done with TTC, with the following settings:

- Cutoff angle: 15°
- IGS rapid orbits
- L1 mode
- Saastamoinen tropospheric model
- Antenna phase centre variation model: NGS relative models.

4.3 Global adjustment

A global adjustment was carried out using the Microsearch Geolab software, version 2001.9.20.0, including the following data (see Annex 6) :

- all GPS baselines with the covariance matrices resulting from the TTC processing,
- the centring equations and height difference for all points located on the same vertical line,
- all the conventional observations: horizontal and vertical angles, distances, levelling,
- the DORIS (PAPB) – GPS (TAHI) baseline measured in 1995.

The ITRF2005 (2000.0) coordinates of the permanent GPS THTI were constrained (1 mm). The network orientation derives mainly from the GPS observations + horizontal angle measured on the most remote point, TAHI, whose coordinates were not constrained. The resulting coordinates for TAHI are within 5 mm of the coordinates published in the ITRF2005 official release, which confirms the correct orientation and scale of the network.

The following a priori standard deviations were used, for the observations done with the total station:

- horizontal angles: 0.8 mgon
- vertical angles: 1.2 mgon
- distances: 1 mm + 1 ppm

4.4 Results

The detailed results (Geolab output file) can be found in Annex 7. The estimated variance factor value (1.12) validates the a priori weighting strategy.

The following tables are excerpts of this file, giving the XYZ coordinates and confidence regions for the reference points of the three space geodesy techniques.

Adjusted XYZ Coordinates:

CODE	FFF	STATION	X-COORDINATE	Y-COORDINATE	Z-COORDINATE
			STD DEV	STD DEV	STD DEV
XYZ	PAPB		-5246579.9325 0.0022	-3076972.9304 0.0021	-1913777.0117 m 0.0020
XYZ	PAQB		-5246414.1977 0.0025	-3077266.6325 0.0026	-1913840.0216 m 0.0027
XYZ	PATB		-5246414.2027 0.0011	-3077266.6359 0.0011	-1913840.0213 m 0.0011
XYZ	SLR 7124		-5246406.8807 0.0013	-3077284.8288 0.0014	-1913814.0863 m 0.0015
XYZ	TAHI		-5246568.8995 0.0016	-3076989.3333 0.0014	-1913777.4275 m 0.0012
XYZ	THTI		-5246415.3220 0.0011	-3077260.2780 0.0011	-1913842.3840 m 0.0011

3D Station Confidence Regions (95.000 percent):			
STATION	MAJ-SEMI (AZ,VANG)	MED-SEMI (AZ,VANG)	MIN-SEMI (AZ,VANG)
PAPB	0.0065 (103, 89)	0.0056 (310, 1)	0.0053 (220, 0)
PAQB	0.0075 (230, 0)	0.0075 (320, 0)	0.0068 (73, 90)
PATB	0.0032 (102, 89)	0.0030 (-6, 0)	0.0030 (276, 1)
SLR 7124	0.0043 (299, 0)	0.0042 (29, 0)	0.0032 (175, 90)
TAHI	0.0051 (184, 90)	0.0034 (86, 0)	0.0032 (356, 0)
THTI	0.0030 (12, 0)	0.0030 (102, 0)	0.0030 (264, 90)

Since this survey was founded by a doubt on the quality of the available tie between the SLR and the GPS, a comparison was made between the value used in the ITRF2005 computation, and the one resulting from the 2007 survey. The following table gives the components in metres of the THTI → SLR MARK vector, and the difference between both survey results:

	ITRF2005 tie (1997 + 1998 surveys)	2007 survey	Difference (X / Y / Z)	<i>Difference</i> (N / E / h)
X	8.4555	8.4412	0.014	-0.003
Y	-24.5510	-24.5506	0.000	0.007
Z	28.2988	28.2975	0.001	-0.012

The global survey result, in the form of a SINEX file, was provided to Zuheir Altamimi, in charge of the computation of the ITRF solutions at IGN. Tests were carried out, which showed that the new values of the THTI → SLR MARK vector agree much better with the GPS and SLR solutions.

5 ACKNOWLEDGEMENTS

We thank the OGT personnel for their support during the survey, as well as for their assistance in getting the equipment cleared through customs.

0. Form

Prepared by (full name) : Jean-Paul CARDALIAGUET
Date Prepared : 2008-04-17
Report Type : UPDATE
If Update:
Previous Site Log : thti_20070913.log
Modified/Added Sections : 3.3,3.4,11

1. Site Identification of the GNSS Monument

Site Name : Tahiti
Four Character ID : **THTI**
Monument Inscription : None (IGNF brass
IERS DOMES Number : **92201M009**
CDP Number : Not assigned
Monument Description : STEEL MAST
Height of the Monument : (m)
Monument Foundation : ROOF
Foundation Depth : (m)
Marker Description : BRASS NAIL
Date Installed : 1998-04-20
Geologic Characteristic : (BEDROCK/CLAY/CONGLOMERATE/GRAVEL/SAND/etc)
Bedrock Type : (IGNEOUS/METAMORPHIC/SEDIMENTARY)
Bedrock Condition : (FRESH/JOINTED/WEATHERED)
Fracture Spacing : (1-10 cm/10-50 cm/50-200 cm/over 200 cm)
Fault zones nearby : (YES/NO/Name of the zone)
Distance/activity : (multiple lines)
Additional Information : (multiple lines)
: (multiple lines)

2. Site Location Information

City or Town : Papeete
State or Province :
Country : Tahiti, French Polynesia
Tectonic Plate : Pacific
Approximate Position (ITRF)
X coordinate (m) : -5246415.200
Y coordinate (m) : -3077260.429
Z coordinate (m) : -1913842.477
Latitude (N is +) : -173436.84
Longitude (E is +) : -1493622.68
Elevation (m,ellips.) : 98.04
Additional Information : Station located in the facilities of UPF
: (Universite de la Polynesie Francaise)

3. GNSS Receiver Information

3.1 Receiver Type : TRIMBLE 4000SSI
Satellite System : GPS
Serial Number : 380A21919
Firmware Version : 7.29
Elevation Cutoff Setting : (deg)
Date Installed : 1998-11-22
Date Removed : 2004-01-12
Temperature Stabiliz. : (none or tolerance in degrees C)
Additional Information : (multiple lines)

3.2 Receiver Type : ASHTECH UZ-12
Satellite System : GPS
Serial Number : 04006
Firmware Version : (A11)
Elevation Cutoff Setting : (deg)
Date Installed : 2004-01-13
Date Removed : 2007-09-17
Temperature Stabiliz. : (none or tolerance in degrees C)
Additional Information : (multiple lines)

3.3 Receiver Type : ASHTECH UZ-12
 Satellite System : GPS
 Serial Number : 04006
 Firmware Version : CN00-1A01
 Elevation Cutoff Setting : 3
 Date Installed : 2008-04-16
 Date Removed : 2008-04-16T07:00Z
 Temperature Stabiliz. : (none or tolerance in degrees C)
 Additional Information : (multiple lines)

3.4 Receiver Type : ASHTECH UZ-12
 Satellite System : GPS
 Serial Number : 48001
 Firmware Version : CN00-1A01
 Elevation Cutoff Setting : 3
 Date Installed : 2008-04-16T07:24Z
 Date Removed : (CCYY-MM-DDThh:mmZ)
 Temperature Stabiliz. : (none or tolerance in degrees C)
 Additional Information : (multiple lines)

PAPEETE DORIS site description form

0. Form

Prepared by : SIMB (DORIS installation and maintenance department)
Date prepared : 7/08/2008
Report type : UPDATE

1. Site location information

Site name : PAPEETE
Site DOMES number : 92201
Host agency : Universite de la Polynesie Francaise
City : Punaauia
State or province : Tahiti, Polynesie Francaise
Country : FRANCE (Polynesia)
Tectonic plate (PB2002) : Pacific
Geological information :

Geographical coordinates (ITRF) :
North Latitude : -17 deg 34' 37''
East Longitude : -149 deg 36' 23''
Ellipsoid height : 100 m
Approximate altitude : 86 m

2. DORIS antenna and reference point information

2.1

Four character ID : PAPB
Antenna model : Starec 52290 type
Antenna serial number : 30
IERS DOMES number : 92201S007
CNES/IGN number : 922012
CTDP number : 66
Date installed (dd/mm/yy) : 27/07/1995
Date removed (dd/mm/yy) : 13/04/1998
Antenna support type : 1 metre tower
Installed on : Top of a load bearing wall of a 3 storied building
Height above ground mark : 1.025 m
Ground mark type : Domed brass mak 12 mm diameter
Ground mark DOMES number : 92201M004
Notes :

2.2

Four character ID : PAQB
Antenna model : Starec 52290 type
Antenna serial number : 39
IERS DOMES number : 92201S008
CNES/IGN number : 922013
CTDP number : 78
Date installed (dd/mm/yy) : 16/04/1998
Date removed (dd/mm/yy) : 01/10/2007
Antenna support type : 1 metre tower
Installed on : Top of a load bearing wall of a 1 storied building
Height above ground mark : 1.415 m
Ground mark type : Domed brass mark 12 mm diameter
Ground mark DOMES number : 92201M008
Notes :

2.3

Four character ID : PATB
Antenna model : Starec 52291 type
Antenna serial number : 123
IERS DOMES number : 92201S010
CNES/IGN number : 922014
CTDP number : 279
Date installed (dd/mm/yy) : 02/10/2007
Date removed (dd/mm/yy) :
Antenna support type : 1 metre tower
Installed on : Top of a load bearing wall of a 1 storied building
Height above ground mark : 1.422 m
Ground mark type : Domed brass mark 12 mm diameter
Ground mark DOMES number : 92201
Notes :

3. DORIS beacons information

* TAHITI GEODETIC OBSERVATORY
* GROUND CONTROL SURVEY PERFORMED IN OCTOBER 2007

COMP ADJ
TITL TAHITI GEODETIC OBSERVATORY - OCT 2007 SURVEY
ELIP WGS 84           6378137.0000   6356752.3142    0.0000    0.0000    0.0000 m  0.000000
0.000000 0.000000 0.000000

CONF YES YES YES YES NO

* POINTS DESCRIPTION

* SLR
* SLR 7124: SLR NASA DISK (DOMES 92201M007), located under the telescope
* SLR AXES INT: intersection of the rotation axes of the telescope (= reference point)
* SLR EYEPIECE: top of the eyepiece on the side of the telescope (used for levelling only)
* SLR TOP: intersection of the self-centering plate on top of the telescope,
*           : and the telescope vertical rotation axis

* PERMANENT GPS
* TAH1: IGN domed mark for former IGS station "TAHI" (DOMES 92201M006)
*       : this mark was labelled "UNIV./UGP1" in the 1995 DORIS survey adjustment
* THTI : IGS point "THTI" = virtual point listed in the ITRF solutions (DOMES 92201M009)
*       : this point is located 1.047 m below the Chokering Antenna Reference Point
*       : (according to the IGS sitelog THTI20070913.LOG)
*       : this point is 2 mm below and 2 mm East of the actual mark THTI MARK
* THTI MARK: IGN domed mark below the antenna of the permanent IGS station "THTI"
* THTI ARP: Chokering Antenna Reference Point of the IGS station "THTI"
* THTI PRISM1: prism centred above THTI MARK
* THTI PRISM2: prism centred above THTI MARK (different height)

* DORIS
* PAPB: former DORIS Starec antenna reference point (1995-07-27 to 1998-04-19) (DOMES 92201S007)
* PAQB: former DORIS Starec antenna reference point (1998-04-19 to 2007-10-01) (DOMES 92201S008)
* PATB: current DORIS Starec antenna reference point (as of 2007-10-02) (DOMES 92201S010)
* PATB MARK: IGN domed mark below the DORIS antennas ("PAQB" then "PATB")
* PATB PRISM: prism centred above the DORIS mark
* PATB PLATE: bottom of the DORIS antenna triangular base plate (used for levelling only)

* PERMANENT MARKS
* RM-2: NASA disk flush with ground, near the north-west corner of the fenced area
* RM-3: forced centring concrete pillar east of the SLR
*       : Reference height is the top of the plate.

* TEMPORARY MARKS
* TM-1: temporary mark 1 = screw in the ground near mark RM-1
* TM-5: temporary mark 5 = tribrach on the roof of the university presidential building,
*       : used only as an azimuth mark
* TM-6: temporary mark 6 = glued target on the roof of the university presidential building

* THTI ITRF2005 (2000.0) coordinates constrained at 1 mm

Maximum Iterations	10
Convergence Criterion	0.00010
Residual Rejection Criterion	Tau Max
Confidence Region Types	1D 2D 3D Station
Variance Factor (VF) Known	Yes
Scale Covariance Matrix With VF	Yes
Scale Residual Variances With VF	No
Force Convergence in Max Iters	No
Distances Contribute To Heights	No
Compute Full Inverse	Yes
Optimize Band Width	Yes
Generate Initial Coordinates	Yes
Re-Transform Obs After 1st Pass	No
Geoid Interpolation Method	Bi-Quadratic

S T A T I S T I C S S U M M A R Y

Residual Critical Value Type	Tau Max
Residual Critical Value	3.6903
Number of Flagged Residuals	2
Convergence Criterion	0.0001
Final Iteration Counter Value	3
Confidence Level Used	95.0000
Estimated Variance Factor	1.1195
Number of Degrees of Freedom	100

Chi-Square Test on the Variance Factor:

8.6406e-01 < 1.0000 < 1.5083e+00 ?

THE TEST PASSES

NOTE: All confidence regions were computed using the following factors:

Variance factor used	=	1.1195
1-D expansion factor	=	1.9600
2-D expansion factor	=	2.4477
3-D expansion factor	=	2.7955

Note that, for relative confidence regions, precisions are computed from the ratio of the major semi-axis and the spatial distance between the two stations.
